**MasterSeal® AWB**  
Fastener Self-Sealing

**PERFORMANCE**  
The ability of an air/water-resistive barrier material to self-seal when punctured with fasteners is a key attribute of material performance. Unfortunately, there are few industry recognized test methods that measure self-sealing performance. ASTM D1970 evaluates self-sealing of nail penetrations. This test involves puncturing the air/water-resistive barrier with two nails, partially withdrawing them, and determining whether leakage will occur when a defined amount of water pressure is applied for a 48-hour time period. While ASTM D1970 provides useful performance data, and MasterSeal AWB air/water-resistive barrier products have successfully met D1970 requirements both with and without MasterSeal AWB 971 FIB/MasterSeal AWB 975 FIB reinforcement, the diverse variety of fasteners used in construction creates a need for additional testing.

**TESTING BASED ON ASTM E331**  
First, a set of 59 fasteners commonly used in construction was selected for evaluation. Second, a set of 8’ x 8’ test panels were constructed per ASTM E331, using both wood and 16-gauge steel studs, and exterior-grade gypsum sheathing. MasterSeal AWB and other air barrier materials were applied to the panels and allowed to dry. Once dry, the fastener set was applied to each panel. These panels were tested for resistance to simulated wind-driven rain. ASTM E331 simulates wind-driven rain by applying a pressure differential across the test panel, then spraying the panel with water at a minimum rate of 5 gallons/ft² hour. Leakage of water through the panel constitutes failure of the test. Four air barrier materials were compared using three pressure differentials. MasterSeal AWB 660, applied at the recommended 10-mils wet film thickness, was compared with a commercially available fluid-applied material applied at 90-mils wet film thickness, a 40-mil asphalt-based self-adhesive membrane and a mechanically-fastened wrap. All materials were applied in strict accordance with procedures outlined by their manufacturer for creation of an air barrier system.

ASTM D1970 test apparatus. This test measures the ability of a barrier material to self-seal around two nails in a manner sufficient to prevent a column of water from seeping through the penetration.
Screws were partially driven through the air barrier materials.

An assortment of fasteners, 59 in all, were used to penetrate the ASTM E331 text panels.

59 commonly used fasteners were tested.

Pressure differentials of 2.86 psf, 6.24 psf and 12 psf were used. This simulates wind-driven rain traveling at 33mph, 50 mph and 69 mph respectively. Testing was run sequentially for 15-minutes at each pressure level, creating a 45-minute test procedure with steadily increasing severity. Over the course of 45-minutes, 240 gallons of water was sprayed at each panel, the equivalent of 6-inches of rain in 45 minutes!
ASTM E331 TEST RESULTS
Panels made using MasterSeal AWB 660 and 40-mil asphaltic self-adhesive membrane did not leak at any pressure levels. All penetrations remained sealed. Panels made with the thicker (90-mil wet film thickness) fluid-applied air barrier material had leakage at several screw penetrations. As the pictures on page 3 illustrate, this material adhered to some of the screws and was partially twisted off of the substrate, creating conditions that led to leakage. Overall, the lowest level of performance was provided by the mechanically-fastened wrap, which exhibited leakage at numerous penetrations starting at the lowest pressure. Several conclusions can be derived from this testing.

- Since the test was able to distinguish between the performance of different materials and rank them in terms of self-sealing capabilities, the method itself was shown to be robust and useful.
- Successful test results were obtained using MasterSeal AWB 660 applied at 10-mils wet film thickness and a 40-mil self-adhesive membrane. Unsuccessful results were obtained with a 90-mil wet film thickness fluid-applied membrane and a thin mechanically-fastened sheet. Material thickness was therefore not a significant factor in determining self-sealing properties.
- MasterSeal AWB 660 and 40-mil asphalt-based self-adhesive membrane offer high levels of self-sealing performance under the tested conditions.

TESTING PERFORMED ACCORDING TO ASTM E2357
The ASTM E2357 Air Leakage of Air Barrier Assemblies involves creation of an 8’ x 8’ mockup, then measuring its resistance to air leakage. A coated opaque panel is used as a reference. For this test, the opaque panel coated with MasterSeal AWB 660 I was tested before and after penetration with 75 2” #8 screws sunk partially through the MasterSeal AWB 660 I prior to testing. This panel allowed 0.0052 l/s/m² prior to screw penetration and 0.0059 l/s/m² after the screws were applied. These results easily exceeded the 0.2 l/s/m² maximum specified under ASTM E 2357.
CONCLUSIONS
MasterSeal AWB 660 and 660 I demonstrated self-sealing capabilities after penetration by nails, screws, and staples. While this test data does not replace the need for careful jobsite installation and professional inspection, it demonstrates that MasterSeal AWB air/water-resistive barrier materials are capable of selfsealing when penetrated by a variety of screws and fasteners.

HEALTH, SAFETY AND ENVIRONMENTAL
Read, understand and follow all Safety Data Sheets and product label information for this product prior to use.
